

ADAM NGUYEN

Sydney ◇ adamnguyxn.au@gmail.com ◇ github.com/adampharrels

EDUCATION

Bachelor of Information Technology, University of Technology Sydney Feb 2024 – Dec 2026
Major: Software Development — Sub-major: Data Analytics & AI
Activities: Community Director - Vietnamese Students Association of NSW, UTS Law Public Speaking Competition; Susquehanna Algothon 2026 (Finished Top 10%)

SKILLS

Languages	Python, SQL, JavaScript, TypeScript, Java, C#
Frontend	Next.js, React, Vite, Angular
Backend & Databases	.NET Core, Spring Boot, Hono.js, Express.js, REST APIs, PostgreSQL, MySQL
Tools & Delivery	Git, Docker, Azure DevOps, CI/CD

EXPERIENCE

Software Engineer Intern Jan 2026 – Present
NexStox

- Developed production **React** and **TypeScript** for a cryptocurrency exchange, building trading, transaction, wallet and administrative workflows connected to REST APIs.
- Contributed to integrating a new external trading venue supporting a tokenised-asset product line by implementing provider-specific readiness checks in the order-routing backend, so an outage in one provider would not block orders routed through another.
- Built an admin panel that cut publishing time by **~50%**, and reduced reliance on frontend developers, enabling non-technical staff to manage users, transactions, and cryptocurrencies and tokens listings.
- Owned the migration of a high-traffic game from **Next.js** to **Vite**, improving build time by **~50%**.

Data Engineer Intern Apr 2026 – Jun 2026
StevTech

- Reduced drone imagery preparation time from hours to seconds by building a **Python ETL pipeline** that processes multi-sensor datasets up to **~50GB** per batch for downstream computer vision models.
- Designed a class-based processor that standardised inconsistent metadata across multiple drones, allowing additional data sources to be integrated without changing existing processing logic.
- Presented product demos and technical outcomes to stakeholders, prospective investors, and university academics, translating complex technical concepts into clear insights for non-technical audiences.

Software Engineer Intern - Full-stack Oct 2025 – Jan 2026
TMA Solutions

- Built an internal workforce planning system using **Next.js**, **Hono.js**, and **PostgreSQL**, designing database schemas and API endpoints for skills matrix, resource allocation, and project analytics.
- Refactored an **Angular** candidate-management dashboard into reusable components, reducing duplicated logic by approximately **~40%**, and wrote **Jasmine** tests to validate component behaviour.
- Reduced manual interactions by developing a multilingual voice-enabled chatbot for machine support and improved accuracy to **90%** by implementing semantic similarity search with vector embeddings.

PROJECTS

StoxLens (<https://github.com/adampharrels/StoxLens>)

- Built an equity analytics platform using **FastAPI** and **PostgreSQL** that combines live market data, news signals, financial metrics, and historical price data to rank watchlist stocks by attention urgency using custom scoring logic for momentum, moving averages, RSI, volatility, drawdown, volume anomalies, and data quality.

UniSpace (<https://github.com/adampharrels/NutriSnap>)

- Built a full-stack study-space booking system using **Spring Boot** and **MySQL**, implementing authentication, room availability, reservations and booking conflict validation.
